

# Web Access Control for Partners

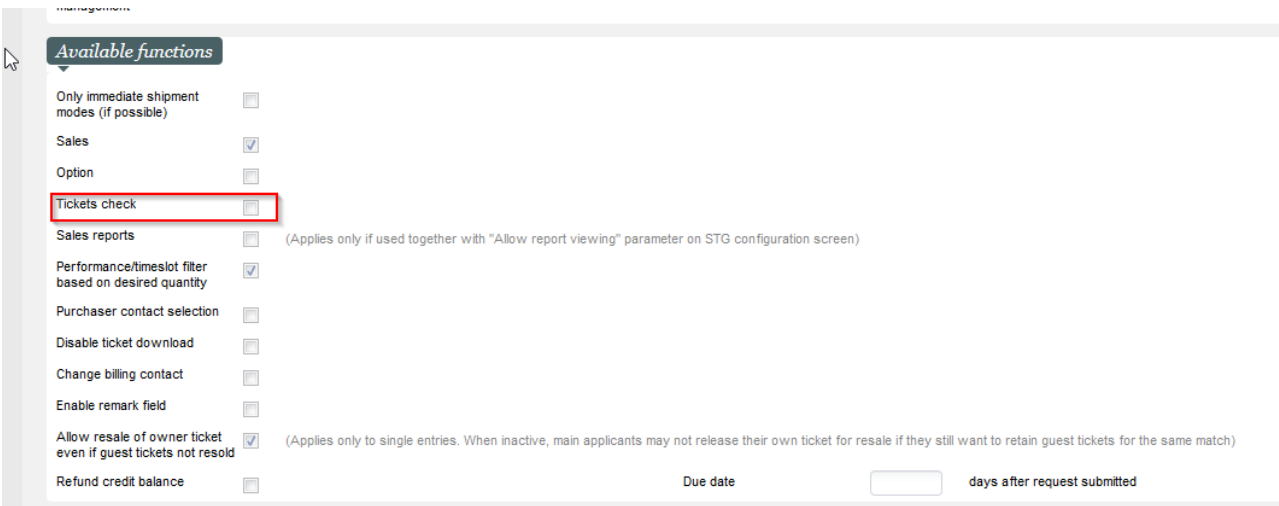

In addition to the mobile solution for validating tickets, there is also the option of scanning tickets via a web interface. For this, you need an online sales channel of the type "Internet Agency" or "Internet B2B".

This kind of access control is meant for partners for which the institution is selling tickets. The partner can use this simplified access control to check that a ticket has not been used before. There are no rules applied, so the ticket must first be checked visually to ensure it's for the correct performance / date / timeslot / tariff, and then scanned on the check screen to ensure unicity.

Then, you will need to activate the "Tickets check" parameter, which can be found under:

Organization Initialisation Sale channel Point of sale Internet Parameter Available functions

At the end, you will find the "Ticket punching" menu in the "Advanced" section of the customer account in the point of sale, where you will have the opportunity to validate barcodes.

Keep your details up to date

We may have to inform you of the postponement or cancellation of an event. We will contact you by email, by phone or by mail to the address you provided when you registered. Please update your contact details regularly.

To avoid entering every barcode manually, SecuTix recommends using a barcode scanner. Please note that the scanner can also read QR / data matrix codes if possible ("2D scanner").
